DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-37 are rejected under 35 U.S.C. 103(a) as being unpatentable over Matsumura et al., 5,365,475, in view of Oliver, 4,567,577.

Matsumura et al., 5,365,475, discloses in Fig. 15 a memory system comprising: micro processor 104;

program memory 106 comprising a plurality of SRAM cells 2 as shown in Fig. 3, each of SRAM cells 2 comprising:

first transistor pair 21 and 23 coupled between voltage supply line 27 and GROUND 28; second transistor pair 22 and 24 coupled between voltage supply line 27 and GROUND 28; voltage supply line 27 selectively connect to first supply voltage V1 in a first mode and connected to a second supply voltage V2 in a second mode;

first access transistor 256;

second access transistor 26;

What is not shown in Figs. 3 and 15 of Matsumura et al., 5,365,475, is the bias transistor as recited in claims 1-8 and 30-35 and the switching device as recited in claims 9-29 and 36-37.

Application/Control Number: 10/812,894

Art Unit: 2827

Oliver, 4,567,577, discloses in Fig. 2 the teaching of activating NMOS transistor 35 for applying a forward negative bias voltage VSS to the substrate of the two transistors 25 and 27 of the SRAM cell (four transistors 24, 25, 27 and 29) in response to the WRITE signal on line 38 is inactive which is inherently present only during the non-ACTIVE WRITE mode/state of the memory device (see lines 1-10, column 3). This effect is called a body effect and uses the so-called back gate bias to control transistor 25 and 27 (see lines 14-20, column 3).

It would have been obvious under 35 USC 103(a) to one of ordinary skill in the art at the time of the invention was made to modify Figs. 3 and 15 of Matsumura et al., 5,365,475, by the teaching as taught in Fig. 2 of Oliver, 4,567,577, for the purpose of providing the body effect to during the non-ACTIVE WRITE mode/state of the memory device to prevent overdrive or overpower the previous state of the SRAM cell in Figs. 3 and 5 of Matsumura et al., 5,365,475 (see lines 14-20, column 3 of Oliver, 4,567,577).

Conclusion

3. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the

Art Unit: 2827

shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Response to Arguments

4. Applicant's arguments filed on 6/6/06 have been fully considered but they are not persuasive because of the following reasons:

All objections to the drawings of the present invention and to the specification as set forth in paragraphs 1-3 of the last office action of 3/6/06 have been withdrawn in view of Applicant's amendments.

Oliver, 4,567,577, does clearly disclose in Fig. 2 the teaching of activating NMOS transistor 35 for applying a forward negative bias voltage VSS to the substrate of the two transistors 25 and 27 of the SRAM cell (four transistors 24, 25, 27 and 29) in response to the WRITE signal on line 38 is inactive which is inherently present only during the non-ACTIVE WRITE mode/state of the memory device (see lines 1-10, column 3). This effect is called a body effect and uses the so-called back gate bias to control transistor 25 and 27 (see lines 14-20, column 3). Therefore, the rejection of claims 1-37 under 35 U.S.C. 103(a) as being unpatentable over Matsumura et al., 5,365,475, in view of Oliver, 4,567,577, is still considered to be totally proper, is repeated and is made FINAL as set forth above.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to TRONG PHAN whose telephone number is (571) 272-
